The Dirt on Construction
Infection Control During Construction/Renovation of HealthCare Facilities

Barb Shea, CIC, MLT, ART Microbiology
Public Health Ontario  Central East RICN
For CHICA SWOICN June 20, 2013
Objectives

• Identify organisms of significance for construction and renovation associated infections

• Z317.13-10 highlights

• Surveillance and IPAC routines
THE IMPORTANCE OF IPAC IN CONSTRUCTION RENOVATION AND MAINTENANCE
What do we mean when we use the term “construction”? 

- Includes demolish, build, renovate, maintain 
- And anything that may create dust or disturb dust 

OH&S Act reg. 213/91 defines construction and constructor
Historical Perspective

• Mid 1990’s patient safety movement prominent in healthcare

• 2001 Health Canada – “Construction-related Nosocomial Infections in Patients in Health Care Facilities Decreasing the Risk of *Aspergillus*, *Legionella* and Other Infections”
Why do Infections Occur?

- Susceptibility of host
- Nature of the exposure
- Virulence of organism
- Inoculum
Construction Issues

- Organisms can travel in dust and water
- Can cause invasive/superficial infections/aggravate conditions
- Patients are susceptible to infection
- High mortality in the immunocompromised
- Difficult to treat!
- Primary culprits... Legionella and Aspergillus
- Health hazards
Patients at Greatest Risk for Construction Related Infections

- Immunosuppressed
- Oncology and haematology units
- Surgical (during and post-op)
- Dialysis
- Critical care
- Multiple Medical Conditions
- Underlying respiratory problems
Health Care Associated Infections

- Spread on hands of HCW’s
- 4th leading cause of deaths in hospitals
- Preventable
- Numerous outbreaks have also been associated with construction and renovation activities

“Construction –related Nosocomial Infections in Patients in HealthCare Facilities Decreasing the Risk of Aspergillus, Legionella and Other Infections and Other Infections”
CCDR July 2001
Health Canada 2001 Report of Infections

- Construction Renovation
  - Inside HC facility
  - Adjacent to HCF

- Ventilation Systems
  - Malfunction
  - Not maintained

- Pseudo-outbreaks
  - Contaminated Blood culture
  - Contaminated bronchoscopy specimens
Construction Activity and Patient Related Outcomes

- Duct and false ceiling demolition, removal of glass fibre insulation and work on roller blinds: *A. fumigatus*
  
Perraud et al 1987

- Repair of false ceiling due to a water leak in a IC supply storage room- contaminated adhesive tape and arm boards

  Grossman et al 1985

- 22 infected/colonized and 18 patients died on an oncology unit

- 6 leukemia patients infected and 2 died (also related to underlying illness)
**A. flavus** and **A. fumigatus**

- Fire in a nearby building and windows being repeatedly opened. Carpet in hall was contaminated – patients on BMT unit
- Connecting bridge between old and new unit allowed dust to circulate from nearby construction and air vent was not properly closed
- 13 infected or colonized patients on BMT unit and 5 of these patients died
  - Gerson et al 1994
- 3 patients on heart transplant unit infected/colonized with 2 deaths
  - Hospital IC 1990
Aspergillus and Zygomcetes

- Aspergillus infections on hematology oncology unit. Four cases prior to construction, 28 during construction and 4 after control measure implemented

- Aspergillus and Zygomcetes infections on pediatric oncology unit during extensive renovation and new construction- windows were opened and reverse pressure system

- 36 infections and 17 deaths
  Loo et al 1996

- Five were infected and died
  Weems et al 1997
2004 Institute of Medicine (IOM)

Linked indoor exposure to mold with:

• upper respiratory tract symptoms
• cough, and wheeze in otherwise healthy people
• with asthma symptoms in people with asthma
• with hypersensitivity pneumonitis in individuals susceptible to that immune-mediated condition.
The Role of Infection Control During Construction in Health Care facilities, AJIC 2000

APIC State of the Art Report

- AIA requires an ICRA
- Early involvement (functional plan)
- Identify number and types of isolation rooms
- Mitigate sources of infection though design (separate patients, placement of hand hygiene facilities)
- Multidisciplinary team
Canadian Standards Association (CSA)

- Z317.13.12
- First released in May 2003 and revised in 2007
- Committee consisted of ICP’s, Government, Microbiologists, Architects, Engineers, Facilities Engineers, Contractors
CSA Z317.13-12 Content Highlights

- Risk factors
- Sources of infections related to construction
- Construction materials
- IPAC procedures
- Key responsibilities
- Prevention measures (before during and after construction)
- Prevention for new construction projects
- Remedial measures
- Quality systems
The Infectious Agent (The Suspects)

**Fungi/Mould**
- Aspergillus
- Penicillium
- Candida
- Zygomycetes
- Fusarium

**Bacteria**
- Legionella
- Bacillus
- Nocardia
- Mycobacteria

Image source: PIDAC Routine Practice and Additional Precautions In All Healthcare settings July 2011
Molds like high cellulose low nitrogen materials

- Fiberboard
- Gypsum
- Paper
- Lint
- Dust

Mold Growth

moisture
Aspergillus species

Aspergillosis

• *A. fumigatus, A. flavus, A. niger*

• *Aspergillus* spores are small (2.5 μm-3.5 μm) and settle very slowly (0.03 cm per second), they can remain suspended in air for long periods

• Found in compost/decaying organic matter

• Infection caused by inhalation of spores/conidia

• Allergic aspergillosis, aspergilloma (hyphae ball), disseminated disease

• Fatality rate is greater than 50%
Aspergillus spp.

- Fungus found in soil, water, dust and organic
- Most common fungus associated with construction/renovation activities
- Rarely causes infection in healthy people except when exposed to large numbers of spores
- In immunosuppressed patients - small numbers of spores can cause progressive pneumonia leading to death
- Can invade other body tissues – abscesses, skin, ear and sinus infections
Where is Aspergillus found in buildings?

- During construction dust along with Aspergillus is disturbed and may become circulated in the air
- Ventilation systems
- Construction/Demolition sites
- False Ceilings
- Air conditioners
- Moldy materials
- Fire proofing materials
- Insulations
- Like cellulose
Aspergillus pneumonia

Background

• A single case is hard to link to environment
• May be linked to environment during construction or renovation.
• Dust disturbance
• Mortality rate is 65-100%

Surveillance

• Prospective - look for other cases
• Retrospective Review
• Microbiology and Histology reports
• Alert clinicians of high risk patients
Bacillus

• Is it a pseudo (false) outbreak?
• Is an organism ubiquitous in the environment
• Has caused infections in certain settings related to construction
Legionella spp

- found in cooling towers, air conditioners, spa equipment, fountains, humidifiers and showers, hot and cold water systems,
- oil/water emulsions used for lubricating lathes, misting devices, decorative fountains and water features,
- dentistry tools, TMV's (thermostatic mixing valves).
- mode of transmission is through inhalation of airborne droplets.
Legionella pneumophila

Legionnaire’s Disease

• Gram Negative bacteria naturally occurring in water
• Infection caused by aspiration/inhalation of bacteria
• Typically causes pneumonia/respiratory failure
• High case fatality rate- diagnosed by a urine culture for legionella antigen
• Found in stagnant water, poorly maintained water systems/cooling towers
Legionella pneumophila

- infects the lungs
- Can cause a sometimes fatal form of pneumonia.
- causative organism of Legionnaires Disease and Pontiac Fever
- symptoms like many other forms of pneumonia
- a high fever, chills and a cough.
- Some people may also suffer from muscle aches and headaches.
- These symptoms usually begin 2 to 14 days after being exposed to the bacteria
Legionella

• Outbreak in LTCH in 2005
• 135 people infected
• 70 residents
• 21 visitors
• 39 staff
• 5 community
• 23 residents died
Legionella headlines

ROLE AND RESPONSIBILITIES OF IPAC DURING CONSTRUCTION AND RENOVATION
Role and Responsibilities of IPAC

Active Member of the Multi-disciplinary Construction / Renovation Team

• Communication
• Setting Standards
• Education and Resources
• Risk Assessment
• Surveillance
• Documentation
Role and Responsibilities of IPAC

Key Players of the Construction/Renovation Team:

- Sr. Administrators
- Plant Operations Manager
- Housekeeping/Environmental Services
- User Groups/Healthcare Staff
- Occupational Health
- Design Professionals
- Constructors
- Communications
Role and Responsibilities of IPAC

Communication:

- Establish clear lines of communication between all involved in the project
- Ensure communication plan is followed during project
- Facilitate communication to maintain essentials for safe practice and IPAC often in the absence of clear-cut guidelines
Roles and Responsibilities: Setting Standards

Policies and Procedures (P&P) are important! They outline:

• What an organization wants done
• Why
• How it is done

They must:

• Be clearly written
• Current
• Communicated well
• Accessible in the organization
Roles and Responsibilities: Policy and Procedure

Examples of policy and procedure documents for construction should include:

• Risk Assessment
• Tendering construction projects includes IPAC requirements
• Products and materials
• Use of barriers
• Cleaning
• Enforcement of IPAC safety measures
• Ensure IPAC Sign off on the project
Role and Responsibilities of IPAC: Education and Resources

• Ensure Construction Committee/maintenance understand risks and importance of preventive measures

• *CSA standards require IPAC practices to maintain resident/staff safety*

• Acts as a role model wearing appropriate PPE, observing restrictions etc.

• Changes to IPAC measures should be made only *after* approval by the ICP
Role and Responsibilities of IPAC

Risk Assessment

• The ICP should be involved in performing a risk assessment for any construction activity within the facility; including minor construction activities.

• Collaborate with medical/nursing staff to identify high-risk residents and move them as needed if they are within and/or adjacent to construction area.
Role and Responsibilities of IPAC

ICP to make regular visits to the construction/renovation site to ensure

- Training of ICP to ensure they know correct procedure
- Measures are followed
- On-site changes are managed accordingly
- Cleaning is occurring
- Check area before residents return
- Communicate concerns and can shut down site if required
Roles and responsibilities: Surveillance

• Consider your risk matrix

• Are you seeing more respiratory illness in this population

• Review culture results

• Report to Infection Control Committee And Administration
Role and Responsibilities of IPAC

Documentation

• All surveillance data collected during and after the project
• Site Audit reports
• All concerns from an IPAC perspective, related activities and problem resolution
• Share your data/concerns with the Construction Committee
• All Construction Committee meetings must have an agenda and detailed minutes
CONSTRUCTION CLASSIFICATION FOR IPAC
Construction

- Difference between new construction and renovation
- Phasing
- Decanting
- Commissioning
- Communication plan
What is the Matrix for Classification?

- Systematic Tool
- Uses evidence to support planning
- Found in CSA Standard Z317.13-07
The Role of Infection Control During Construction in Health Care facilities, AJIC 2000

APIC State of the Art Report

• AIA requires an ICRA
• Early involvement (functional plan)
• Identify number and types of isolation rooms
• Mitigate sources of infection though design (separate patients, placement of hand hygiene facilities)
• Multidisciplinary team
# Risk Assessment and Prevention Measures

<table>

REFERENCE TABLE 1 CSA Z317.13-10
Risk Group 1: Low Risk

- Unoccupied wards
- Public Areas
- Office Areas
- Physical plant workshops
- Laundry
- Housekeeping areas
Risk Group 2: Moderate Risk

- Patient care areas (not in group 3 or 4)
  - Morgue
  - Autopsy
- Outpatient clinics (not oncology or surgery)
  - Admission / Discharge units
  - Waiting rooms
- Physiotherapy
- Occupational
Risk Group 3: Moderate to High Risk

- Geriatrics
- Paediatrics
- Labour and Birthing rooms
- Diagnostic Imaging
- ER (Except Trauma)
- LTC
- Surgical Units
- Respiratory therapy
- Nuclear Medicine and Labs
- Food prep, serving/dining
- Medical Units
- Hydrotherapy, echocardiography
Risk Group: 4 High Risk

ICU, OP, PACU, Anaesthesia and storage areas

Oncology IP and OP

Transplant IP and OP

IP and OP for AIDS, dialysis and immune deficient patients.

Dialysis, NICU, L&D, OR rooms

Endoscopy

Pharmacy admixture rooms

Sterile reprocessing rooms

Sterile supply areas

Burn care units, trauma rooms, tissue culture labs

Bronchoscopy, cystoscopy

Pacemaker insertion, dental procedure rooms, CPD
Type of Work To Be Done

**Type A**
Inspection Activities
Non-invasive Activities

**Type B**
Small Scale Activities
Minimal dust generated

**Type C**
High Level of Dust
Require Demolition
Removal of fixed component or assembly or can’t be completed in one work-shift

**Type D**
High Levels of Dust
Major Demolition
Major Construction
More than one work-shift
# Prevention Measures

REFERENCE TABLE 1  
CSA Z317.13-10
Prevention Measures Level I

Before:

• Very simple
• Project manager identifies the service disruptions
• May need to consider alternate water supplies
• Identify any high risk patients (HR) that may need to be moved
• Move HR patients if air quality is going to be reduced
Prevention Measures Level I

During:

• Replace tiles after work is completed
• Clean area with HEPA filter vacuum cleaner if necessary
• Protect patient care equipment and supplies from dust exposure

After:

• Debrief and evaluate prevention measures
Prevention Measures Level II

( include level 1 measures too)

Before

• Identify routes for transport of clean/sterile supplies and equipment
• Identify route for construction workers travel so they avoid patient care areas
• Obtain drawings and ensure exhaust is not recirculated to HCF (including designated elevator)
• Assess and identify plumbing lines affected by construction and either shut off or isolated by adding valves
• Determine water sanitizing and start-up policy (equipment, flow path, procedures)
Prevention Measures Level II

During:

• Minimize and control dust (e.g. drop sheets, water misting, seal windows, air vents unused doors, plumbing penetrations & electrical outlets, waste removed in covered containers)
• Use walk-off mats and keep entrance to area clean
• Disable HVAC system in construction area or ensure engineering analysis is performed to ensure system not compromised.
• Establish negative air pressure that is exhausted outside
• Flush water lines before reuse
• Regular audits to ensure prevention measures in place
Prevention Measure Level II

After:

• Review audit results with contractor to evaluate prevention measures

• Conduct final inspection:
  • ensure HVAC system is working properly
  • clean with HEPA filtered vacuum followed by hospital grade disinfectant
Prevention Measures Level III

Before, During & After:

• Implement Measures I and II

• Meet with multidisciplinary team to determine IPAC measures according to Table 1 in Z317.13 document

• Minimize dust generation and dispersal: proper barriers used

• Ventilation systems: negative pressure

• IPAC responsibilities: cleaning, barrier integrity, traffic patterns
Prevention Measure Level IV

Before:
• Implement Measures I, II and III

During:
• Access construction area either from outside or through an anteroom if access is from inside

After:
• Use caution to remove barriers and prevent contamination of environment during removal, clean area, multidisciplinary team inspect using checklist, debrief and evaluate.
Assessment and Ongoing Activities
Assessment and Ongoing Activities: Before Construction

- Workers and staff have IPAC education
- Patient exposure to construction area minimized, staff restricted
- Consider moving high risk patients away from the construction area
- Protect supplies
- Protect equipment
- Define cleaning responsibilities
- Contingency plans for service interruptions
- Traffic Patterns established
- Protect materials from moisture and inspect
Before Work Begins

- Determine IPAC risk class and prevention measures
- IPAC requirements are in the work orders/tender documents
- Adhere to CSA standards
- ICPs are educated on construction/renovation and design issues
- ICP has a policy/protocol to enable a stop work order
- Clean up of work areas during all stages is clearly defined
- Engineering controls are in place to reduce airborne contaminants
- Remove hazardous materials e.g. sharps
Assessment and Ongoing Activities: During Construction

- Look for water leaks to walls building materials and supplies
- Water disruptions – schedule during low volume times
- Ensure access panels and ceiling tiles are replaced after inspection
- Seal windows and doors, plumbing penetrations, electrical outlets, intake /exhaust vents
- Monitor negative pressure and HEPA filtration
- Replace walk off mats as needed
- Clean area within the construction zone - wet mopped
- Vacuum with a HEPA filter
- Increase frequency of cleaning in areas adjacent to the construction zone
- Transport supplies and equipment in covered containers
- Remove debris at the end of the work day, or in low traffic times
- Cover debris in containers before transporting
Assessment and Ongoing Activities: After Construction

- Flush water lines prior to use
- Ensure proper water temperature
- Follow with environmental services clean
- Run the exhaust fans after the completion of the construction to remove airborne particulates
- Clean up area with HEPA vacuum
- Change air filters / clean as necessary in construction areas
- Ensure that the ventilation system is functioning properly in the construction area and adjacent areas
- Debrief/share results
Barriers

- Polyethylene plastic
- Drywall/Gypsum
- Seal at all edges
- Seal above the false ceiling
Hoarding

Image Source: PHO Archive
Solid Hoarding – Ante rooms

Image Source: PHO Archive
Before Construction  CHICA Audit Tools Combined*

- Workers and staff have IPAC education
- Patient exposure to construction area minimized, staff restricted
- Consider moving high risk patients away from the construction area

*These have been combined and you should consult tools for the specifics related to prevention matrix

- Protect supplies
- Protect equipment
- Define cleaning responsibilities
- Contingency plans for service interruptions
- Traffic Patterns established
- Protect materials from moisture and inspect
During Construction* 

- Look for water leaks to walls building materials and supplies 
- Water disruptions – schedule during low volume times 
- Ensure access panels and ceiling tiles are replaced after inspection 
- Seal windows and doors, plumbing penetrations, electrical outlets, intake /exhaust vents 
- Monitor negative pressure and HEPA filtration 
- Replace walk off mats as needed 
- Clean area within the construction zone - wet mopped 
- vacuum with a HEPA 
- Increase frequency of cleaning in areas adjacent to the construction zone 
- Transport supplies and equipment in covered containers 
- Remove debris at the end of the work day, or in low traffic times 
- Cover debris in containers before transporting
After Construction*

- Flush water lines prior to use
- Ensure proper water temperature
- Follow with environmental services clean
- Run the exhaust fans run after the completion of the construction to remove airborne particulates
- Clean up area with HEPA vacuum
- Change air filters / clean as necessary in construction areas
- ensure that the ventilation system is functioning properly in the construction area and adjacent areas
- Debrief/publish results
Successful Surveillance

• Be visible
  • Inspect daily
• Communicate
• Focus on Safety
• Management support
• Education consider a program that includes OH&S and Fire Safety
• Be involved from functional design to cleanup
Lessons Learned

• Avoid making errors that others have made

• Who: define responsibilities, define populations at risk, utilize your network

• What: Use the standards and have a predetermined plan, tap into the experts, 

• Where: assess interventions in all areas

• When: in doubt consult other experts, get involved at the functional plan phase

• How: microbiology reports, clinicians, retrospective and prospective case finding, permits, walkabouts

• Why: patient and staff safety, legal implications, reputation, financial
Really important tools for the ICP to have:

• A hard hat - so you don’t hurt yourself while banging your head against the wall
• Safety boots – to protect your feet when people are stepping on your toes
• A Flashlight – to light your way to the car because you are here again after dark
• A camera - because you can’t rely on your memory
